

Backpropagation

Overview

- Computation graphs
- Using the chain rule
- General backpropagation algorithm
- Toy examples of backward pass
- Matrix-vector calculations: ReLU, linear layer

Last time: Multi-layer neural networks

- The function computed by the network is a composition of the functions computed by individual layers (e.g., linear layers and nonlinearities):

- More precisely:

Training a multi-layer network

- What is the SGD update for the parameters w_k of the k th layer?

$$w_k \leftarrow w_k - \eta \frac{\partial e}{\partial w_k}$$

- To train the network, we need to find the **gradient of the error w.r.t. the parameters of each layer**, $\frac{\partial e}{\partial w_k}$

Computation graph

The chain rule

$$\frac{dz}{dx} = \frac{dz}{dy} \frac{dy}{dx}$$

In **calculus**, the **chain rule** is a **formula** that expresses the **derivative** of the **composition** of two **differentiable functions** f and g in terms of the derivatives of f and g . More precisely, if $h = f \circ g$ is the function such that $h(x) = f(g(x))$ for every x , then the chain rule is, in **Lagrange's notation**,

$$h'(x) = f'(g(x))g'(x).$$

or, equivalently,

$$h' = (f \circ g)' = (f' \circ g) \cdot g'.$$

The chain rule may also be expressed in **Leibniz's notation**. If a variable z depends on the variable y , which itself depends on the variable x (that is, y and z are **dependent variables**), then z depends on x as well, via the intermediate variable y . In this case, the chain rule is expressed as

$$\frac{dz}{dx} = \frac{dz}{dy} \cdot \frac{dy}{dx}$$

https://en.wikipedia.org/wiki/Chain_rule

Applying the chain rule

Let's start with $k = 1$

$$e = l(f_1(x, w_1), y)$$

Example: $e = (y - w_1^T x)^2$

$$h_1 = f_1(x, w_1) = w_1^T x$$

$$e = l(h_1, y) = (y - h_1)^2$$

$$\frac{\partial e}{\partial w_1} =$$

Applying the chain rule

$k = 2$

$$e = l(f_2(f_1(x, w_1), w_2))$$

Example: $e = -\log(\sigma(w_1^T x))$ (assume $y = 1$)

$$h_1 = f_1(x, w_1) = w_1^T x$$

$$h_2 = f_2(h_1) = \sigma(h_1)$$

$$e = l(h_2, 1) = -\log(h_2)$$

Applying the chain rule

Example: $e = -\log(\sigma(w_1^T x))$ (assume $y = 1$)

$$h_1 = f_1(x, w_1) = w_1^T x$$

$$h_2 = f_2(h_1) = \sigma(h_1)$$

$$e = l(h_2, 1) = -\log(h_2)$$

$$\frac{\partial h_1}{\partial w_1} =$$

$$\frac{\partial h_2}{\partial h_1} =$$

$$\frac{\partial e}{\partial h_2} =$$

$$\frac{\partial e}{\partial w_1} = \frac{\partial e}{\partial h_2} \frac{\partial h_2}{\partial h_1} \frac{\partial h_1}{\partial w_1} =$$

Chain rule: General case

$$\frac{\partial e}{\partial w_k} = \frac{\partial e}{\partial h_K} \frac{\partial h_K}{\partial h_{K-1}} \cdots \frac{\partial h_{k+1}}{\partial h_k} \frac{\partial h_k}{\partial w_k}$$

Upstream gradient

$$\frac{\partial e}{\partial h_k}$$

Local gradient

Backpropagation summary

Dealing with vectors

$$\frac{\partial z}{\partial x} = \begin{pmatrix} \frac{\partial z^{(1)}}{\partial x^{(1)}} & \cdots & \frac{\partial z^{(1)}}{\partial x^{(M)}} \\ \vdots & \ddots & \vdots \\ \frac{\partial z^{(N)}}{\partial x^{(1)}} & \cdots & \frac{\partial z^{(N)}}{\partial x^{(M)}} \end{pmatrix}$$

$N \times M$
Jacobian

Jacobian: row indices correspond to outputs, column indices correspond to inputs. The i, j th element of the Jacobian is the partial derivative of the i th output w.r.t. j th input

Simple case: Elementwise operation

Simple case: Elementwise operation (ReLU layer)

$$\frac{\partial z}{\partial x} = \begin{pmatrix} \frac{\partial z^{(1)}}{\partial x^{(1)}} & \cdots & \frac{\partial z^{(1)}}{\partial x^{(M)}} \\ \vdots & \ddots & \vdots \\ \frac{\partial z^{(M)}}{\partial x^{(1)}} & \cdots & \frac{\partial z^{(M)}}{\partial x^{(M)}} \end{pmatrix}$$

$M \times M$
Jacobian

What does the Jacobian for an elementwise function look like?

Simple case: Elementwise operation (ReLU layer)

$$\frac{\partial z}{\partial x} = \begin{pmatrix} \frac{\partial z^{(1)}}{\partial x^{(1)}} & \dots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \dots & \frac{\partial z^{(M)}}{\partial x^{(M)}} \end{pmatrix}$$

$M \times M$
Jacobian

What does the Jacobian for an elementwise function look like?

Simple case: Elementwise operation (ReLU layer)

$$\frac{\partial z}{\partial x} = \begin{pmatrix} \mathbb{I}[x^{(1)} > 0] & \dots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \dots & \mathbb{I}[x^{(M)} > 0] \end{pmatrix}$$

$M \times M$
Jacobian

$$\frac{\partial e}{\partial x^{(i)}} = \frac{\partial e}{\partial z^{(i)}} \mathbb{I}[x^{(i)} > 0]$$

What happens if some $x^{(i)}$ is always negative?

$$\frac{\partial e}{\partial x} = \frac{\partial e}{\partial z} \odot \mathbb{I}[x > 0]$$

This is known as the “dead ReLU” problem

What about sigmoid?

$$\frac{\partial z}{\partial x} = \begin{pmatrix} \sigma'(x^{(1)}) & \dots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \dots & \sigma'(x^{(M)}) \end{pmatrix}$$

$M \times M$
Jacobian

$$\frac{\partial e}{\partial x^{(i)}} = \frac{\partial e}{\partial z^{(i)}} \sigma'(x^{(i)})$$

Derivative vanishes unless the input value is close to zero!

Matrix-vector multiplication (linear layer)

Matrix-vector multiplication (linear layer)

$$(z^{(1)} \quad \dots \quad z^{(N)}) = (x^{(1)} \quad \dots \quad x^{(M)}) \begin{pmatrix} W^{(11)} & \dots & W^{(1N)} \\ \vdots & \ddots & \vdots \\ W^{(M1)} & \dots & W^{(MN)} \end{pmatrix} \quad z^{(j)} = \sum_{i=1}^M x^{(i)} W^{(ij)}$$

Want: $\frac{\partial e}{\partial x} = \frac{\partial e}{\partial z} \frac{\partial z}{\partial x}$

$1 \times M$ $1 \times N$ $N \times M$

$$\frac{\partial z^{(j)}}{\partial x^{(i)}} =$$

j th row, i th column
of Jacobian

$$\frac{\partial z}{\partial x} = W^T$$

Matrix-vector multiplication (linear layer)

$$(z^{(1)} \quad \dots \quad z^{(N)}) = (x^{(1)} \quad \dots \quad x^{(M)}) \begin{pmatrix} W^{(11)} & \dots & W^{(1N)} \\ \vdots & \ddots & \vdots \\ W^{(M1)} & \dots & W^{(MN)} \end{pmatrix} \quad z^{(j)} = \sum_{i=1}^M x^{(i)} W^{(ij)}$$

Want: $\frac{\partial e}{\partial x} = \frac{\partial e}{\partial z} \frac{\partial z}{\partial x}$

$1 \times M \quad 1 \times N \quad N \times M$

$$\frac{\partial z^{(j)}}{\partial x^{(i)}} = W^{(ij)} \quad \text{jth row, } i\text{th column of Jacobian}$$

$$\frac{\partial z}{\partial x} = W^T$$

$$\frac{\partial e}{\partial x} = \frac{\partial e}{\partial z} \frac{\partial z}{\partial x} = \frac{\partial e}{\partial z} W^T$$

Matrix-vector multiplication (linear layer)

$$(z^{(1)} \quad \dots \quad z^{(N)}) = (x^{(1)} \quad \dots \quad x^{(M)}) \begin{pmatrix} W^{(11)} & \dots & W^{(1N)} \\ \vdots & \ddots & \vdots \\ W^{(M1)} & \dots & W^{(MN)} \end{pmatrix}$$

$$z^{(j)} = \sum_{i=1}^M x^{(i)} W^{(ij)}$$

Want: $\frac{\partial e}{\partial W} = \frac{\partial e}{\partial z} \frac{\partial z}{\partial W}$

$M \times N$ $1 \times N$ $N \times (M \times N)$

$$\frac{\partial z^{(k)}}{\partial W^{(ij)}}$$

$z^{(k)}$ depends only
on k th column of W

Matrix-vector multiplication (linear layer)

$$(z^{(1)} \quad \dots \quad z^{(N)}) = (x^{(1)} \quad \dots \quad x^{(M)}) \begin{pmatrix} W^{(11)} & \dots & W^{(1N)} \\ \vdots & \ddots & \vdots \\ W^{(M1)} & \dots & W^{(MN)} \end{pmatrix}$$

$$z^{(j)} = \sum_{i=1}^M x^{(i)} W^{(ij)}$$

Want: $\frac{\partial e}{\partial W} = \frac{\partial e}{\partial z} \frac{\partial z}{\partial W}$

$M \times N$ $1 \times N$ $N \times (M \times N)$

$$\frac{\partial z^{(k)}}{\partial W^{(ij)}} = \mathbb{I}[k = j] x^{(i)}$$

$z^{(k)}$ depends only on k th column of W

$$\frac{\partial e}{\partial W^{(ij)}} = \frac{\partial e}{\partial z} \frac{\partial z}{\partial W^{(ij)}}$$

Matrix-vector multiplication (linear layer)

$$(z^{(1)} \quad \dots \quad z^{(N)}) = (x^{(1)} \quad \dots \quad x^{(M)}) \begin{pmatrix} W^{(11)} & \dots & W^{(1N)} \\ \vdots & \ddots & \vdots \\ W^{(M1)} & \dots & W^{(MN)} \end{pmatrix}$$

$$z^{(j)} = \sum_{i=1}^M x^{(i)} W^{(ij)}$$

Want: $\frac{\partial e}{\partial W}$ $M \times N$ = $\frac{\partial e}{\partial z}$ $1 \times N$ $\frac{\partial z}{\partial W}$ $N \times (M \times N)$

$$\frac{\partial e}{\partial W^{(ij)}} = \frac{\partial e}{\partial z^{(j)}} x^{(i)}$$

$$\frac{\partial e}{\partial W} = \begin{pmatrix} \frac{\partial e}{\partial z^{(1)}} x^{(1)} & \dots & \frac{\partial e}{\partial z^{(N)}} x^{(1)} \\ \vdots & \ddots & \vdots \\ \frac{\partial e}{\partial z^{(1)}} x^{(M)} & \dots & \frac{\partial e}{\partial z^{(N)}} x^{(M)} \end{pmatrix}$$

Matrix-vector multiplication (linear layer)

$$(z^{(1)} \quad \dots \quad z^{(N)}) = (x^{(1)} \quad \dots \quad x^{(M)}) \begin{pmatrix} W^{(11)} & \dots & W^{(1N)} \\ \vdots & \ddots & \vdots \\ W^{(M1)} & \dots & W^{(MN)} \end{pmatrix}$$

$$z^{(j)} = \sum_{i=1}^M x^{(i)} W^{(ij)}$$

Want: $\frac{\partial e}{\partial W}$ $=$ $\frac{\partial e}{\partial z}$ $\frac{\partial z}{\partial W}$

$M \times N$ $1 \times N$ $N \times (M \times N)$

$$\frac{\partial e}{\partial W} = x^T \frac{\partial e}{\partial z}$$

Matrix-vector multiplication (linear layer)

- Summary of backward pass:

General tips

- Derive error signal (upstream gradient) directly, avoid explicit computation of huge local derivatives
- Write out expression for a single element of the Jacobian, then deduce the overall formula
- Keep consistent indexing conventions, order of operations
- Use dimension analysis
